

Data Source Properties

Within the modal window, you are able to edit the attribute mapping which were initially shown during the upload process of the product data (see [Attribute Mapping](#)).

You are also able to specify a global value for the multi value separator. As a consequence all attributes with enabled multi values (see [Data Attributes Table](#)) use this separator. Note that each attribute can override the value within the [Data Attribute Values](#) modal window.

If you are using channel ids, you can also select a **default channel id**. This channel id is always displayed if you open the *Preview* or *Site Integration* view.
