

# Setting Preset Parameter in the Workbench

In the [Site Integration](#) view you are able to set the preset parameter described in [Initialize the Product Guide with URL Parameters](#).

### Configure Integration Code

Environment 

Live Stage

Add Preset Parameters

Quick Link  
[service.excentos.com/playground/DE/app\\_Test/default.start?xcLocale=en\\_US](https://service.excentos.com/playground/DE/app_Test/default.start?xcLocale=en_US)

If you click on the highlighted link, a modal window appears. Within that window, you can add Question-Answer Option pairs as advisor preselections as well as the starting point of your product guide. By default, the first Stage is selected.

After all presets are defined, the integration URL is updated by confirming the dialog with the "Update URL" button.

### Configure Presets for your Product Guide

Start your Product Guide with **preselected Questions** or choose on which Stage (other than the first) the advising process should begin. All presets are added as **URL parameters** (see resulting integration code).

Question Preselections

+ Add Preselection

Cancel Update URL

#### Note

The presets are not stored in the database. Hence, if you leave the Workbench session the presets are no longer set. So only configure the presets if you are ready to integrate the code into your website.
